Microprobe Analysis

Analytical conditions on the JEOL-8600 microprobe were 25 kV and 20 nA with a 5 µm beam diameter. Details on selected X-ray lines, backgrounds, standards and counting times are listed in Table S1. Background positions were chosen to avoid interferences, and all analyses were corrected for major peak interferences (see detail in Allaz *et al.*, 2013). A new microprobe JEOL JXA-8230 with large-area monochromators and new standards (Table S2) became available only after completion of the project. This new instrument and its state-of-the-art software from Probe Software notably allowed for more precise determination of interference correction factors and better matrix correction, which ultimately lead to more accurate results. The 3-fold increase in X-ray intensity collected on large area monochromators permit to decrease the acceleration voltage to 15 keV to gain higher spatial resolution without cutting on the precision. The beam current was increased to 50 nA to further improve precision. The Mean Atomic Number background correction method (MAN; Donovan and Tingle, 1996) was used to shorten the total analysis time and to eliminate problems of background interferences. Similar results were obtained in comparison measurements of several hundred analysis points on the White Cloud samples using a new microprobe JEOL JXA-8230 with large-area monochromators with new standards. A similar analytical setup was used, with the main difference that the mean atomic number (MAN) background correction was used on all elements (Donovan and Tingle, 1996).

New analyses (Table S7) in the White Cloud samples yield much higher precision and accuracy. Unfortunately, the crystal fragment for the XRD work were extracted from the samples after the EMP analysis, and we were thus not able to repeat the analyses of Golden Horn samples on the new microprobe. However, from the analysis of different remaining sample areas using the new instrument we could confirm that the Si content is 3 apfu within the statistical error (2.98 ± 0.03). We have therefore renormalized the old EMP results in Table 1 to Si=3 apfu. This also corrects the apparent value of <3 apfu for the sum of 3+ and 2+ cations (Na is negligible) and REE + (U,Th) + (Ca,Mn,Sr) = 3 apfu within the measurement uncertainty.

Most analyses reveal a high F-content, which exceeds the full-site occupancy (average ~1.15 apfu). This discrepancy is likely due to the imprecise measurement (low count-rate) of F K α , beam damage effect, or inaccuracy in the interference correction from Ce M ζ . We decided to recalculate the wt.% of F assuming full (OH,F)-site occupancy (1 apfu). This assumption does not affect the results presented here. Note that EMPA analysis of fluorine is still not a routine task (Stromer *et al.*, 1993; Raudsepp, 1995; Ottolini *et al.*, 2000; Goldoff *et al.*, 2012).

High Si-content on data obtained on the JEOL-8600 microprobe are likely due to quartz or other micron-sized silicate-rich inclusions. Effect of these inclusions is more likely to occur with analyses performed on the JEOL-8600 microprobe due to the higher acceleration voltage used and the resulting larger analytical volume (spatial resolution in thalenite-(Y) is ca. 2 μm at 15 keV, versus ca. 5 μm at 25 keV). We also note an increase in totals for the analyses of White Cloud sample regions with particularly high Yb content, the cause of which remains unclear; it could be related to inaccuracy on the matrix correction or due to the nature of the sample (higher susceptibility to beam damage, presence of inclusion, etc.).

Tables S5 and S6 show all raw element wt. % data for the Golden Horn and White Cloud EMPA points respectively; this data is presented in the manuscript and was acquired on the JEOL-8600 microprobe. Table S7 shows White Cloud data taken with the newer, JEOL JXA-8230 microprobe, and shows improved precision and accuracy. Table S8 shows the element wt. % for sample WC01 11 taken on the JEOL-8600 microprobe and includes the calculated oxide wt. % and apfu for both fixed Si = 3 (apfu) and unfixed Si.
